## What is the Hop & Wobble Phenomena?

And how can we help reduce it?

Hollow bore shaft mounted reducers are subject to "Hop & Wobble" movement. "Hop" is the observed movement of a shaft mounted reducer in a direction perpendicular to the axis of the output shaft. "Wobble" is the observed side to side rocking motion of a shaft mounted reducer. To some extent, both of these phenomena are always present ... [\(read on\)...](#)
